

Elegant Code vs Learning Trading

If you are a Python expert, you might realise that some of our code is not elegant.

I might take 3 lines of code to do something that can be done in 1.

This is because we are focused on ease of learning and code readability.

Ease of Learning

Achieving a task in 1 longer line of code might be more efficient, but it is harder for beginners to follow the coding logic and learn.

We want to minimise the learning curve and time.

More effort should be spent on learning trading and not coding.

Students can focus on improving the efficiency of their code and beautify it later once they sort out the trading part.

Code Readability

This is similar to the above.

We want students to be able to understand the code when they read it, instead of pausing every 10 seconds to figure out what each line of code means.

Takeaway

We are here to train traders and coding is just a tool for us to get there!
